

CLASS- REPTILIA

GENERAL CHARACTERISTICS:

- 1. Habitat & Habit:** Mostly **terrestrial** and a few such as tortoises, crocodiles etc., are **secondarily adapted to aquatic life**. Mostly **carnivorous** and **predatory**; **crawling** or **burrowing** and a few are **herbivorous**.
- 2. Body form:** The body may be **short and broad** or **long and narrow**, or **cylindrical**.
- 3. Body symmetry:** The body is **bilaterally symmetrical** and divisible into 4 regions, head, neck, trunk and tail.
- 4. Appendages:** The trunk bears two pairs of **pentadactyle limbs** with **horny clawed digits**. The limbs are absent in few lizards and snakes.
- 5. Exoskeleton:** The body is covered by **horny epidermal scales, shields, plates** and **scutes** to check loss of water. Snakes and lizards shed their skin periodically by the process called **moulting**. The skin is dry, cornified (tough) and non-glandular.
- 6. Endoskeleton:** The endoskeleton is **bony**. The skull has a single occipital condyle (monocondylar) and the inter clavicle is 'T'- shaped.
- 7. Body temperature:** Reptiles are **cold-blooded animals** or **poikilotherms**. Some forms raise their body temperature by exposure to sun. They hibernate during winter.
- 8. Digestive system:** The alimentary canal is **complete** with openings, mouth and cloaca at extreme ends. The mouth is bounded by jaws which bear simple conical teeth. In **turtles' teeth** are replaced by **horny beaks**. The **tongue** may be **intact or bifid** and can be **protrusible or non-protrusible**.
- 9. Respiratory system:** Respiration is **pulmonary**. Ribs help to expand and contract the body cavity for breathing.

- 10. Circulatory system:** The heart is **3-chambered** (incompletely divided 4 chambers) with 2 auricles and partially divided ventricle. In **crocodiles**, the heart is **4-chambered**. RBCs are nucleated, oval and biconvex. The sinus venosus is reduced. There are only **3 aortic arches**.
- 11. Nervous system:** The **cerebral hemispheres** are **smooth**, fairly **large** and the **cerebellum** is **small** and poorly developed. The **optic lobes** are **well developed**. There are **12 pairs of cranial nerves**.
- 12. Excretory system:** The kidneys are **metanephric**. The **terrestrial forms** are **uricotelic** and **aquatic forms** are **ureotelic**.
- 13. Sense organs:** Senses of **vision** and **smell** are **well developed**. Eyes mostly distinguish well only moving objects. **Snakes** have **Jacobson's organ** for **smelling**. Several reptiles use tongue as tactile organ as well. The majority of reptiles have poorly developed sense of hearing. They can only sense the vibrations of earth in most cases.
- 14. Reproductive system:** Sexes are separate and exhibit **sexual dimorphism**. Males generally have a single or paired muscular copulatory organs.
- 15. Development:** Fertilization is internal. Mostly **oviparous** and some are **ovo-viviparous or viviparous**. Eggs are large, macrolecithal and cleidoic (covered by hard or leathery shell). There is no metamorphosis hence development is direct. They are **amniotes** as extra embryonic membranes like amnion, allantois, yolk sac and chorion are formed during development.

CLASSIFICATION:

- I. **Subclass – Anapsida** (Primitive reptiles- the roof of the skull lacks a temporary opening)

Order 1: Chelonia:

E.g. Chelone mydas (green turtle)- Marine

Testudo (giant galapagos tortoise)-Terrestrial

Chelodine (long necked turtle)

Chrysemys (painted tortoise)

II. Subclass – Diapsida (skull with 2 temporal openings)

Order 1: Rhyncocephalia: (Only one sole living species of New Zealand)

E.g. Sphenodon punctatum (Tuatara lizard)

Order 2: Squamata (2 Suborders)

Suborder i. Lacertelia – E.g. Calotes (gardenlizard)

Draco (flying lizard)

Chameleon

Suborder ii. Ophidia – E.g. Naja naja (common cobra)

Bungarus (krait)

Vipera russelli (Russell's viper)

Python, etc.,

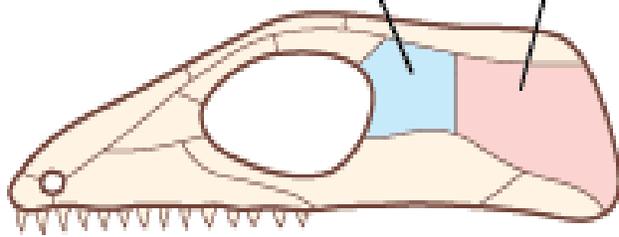

Order 3. Crocodilia – E.g. Crocodylus

Alligator

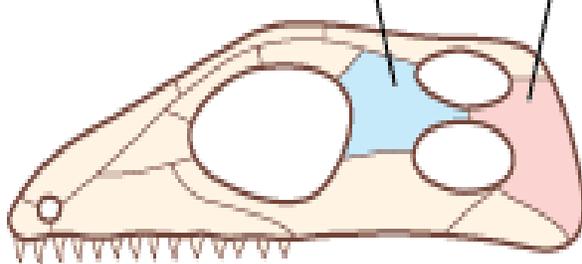

Sphenodon punctatum (Tuatara lizard)

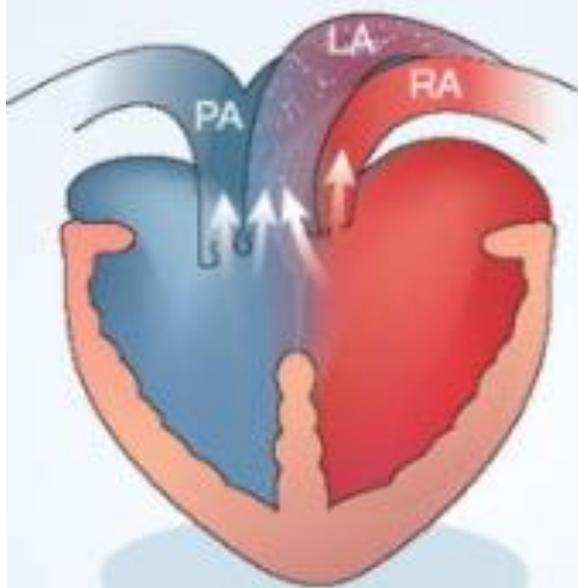

anapsid postorbital squamosal

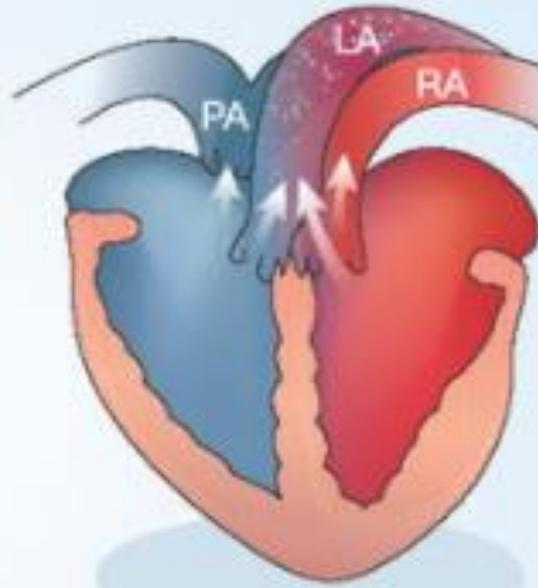

diapsid postorbital squamosal

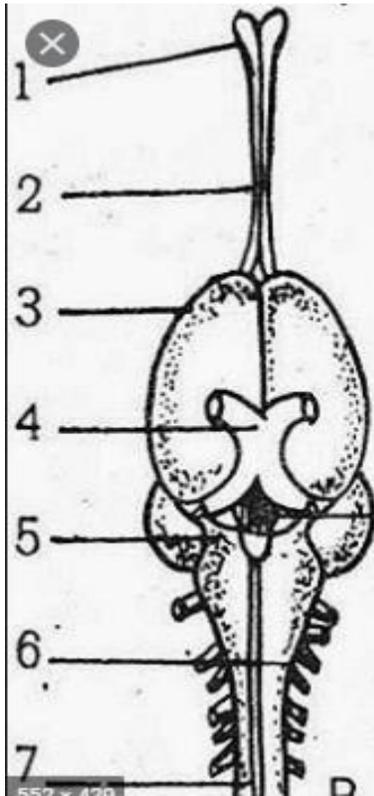

b Turtles, snakes and lizards

c Crocodiles

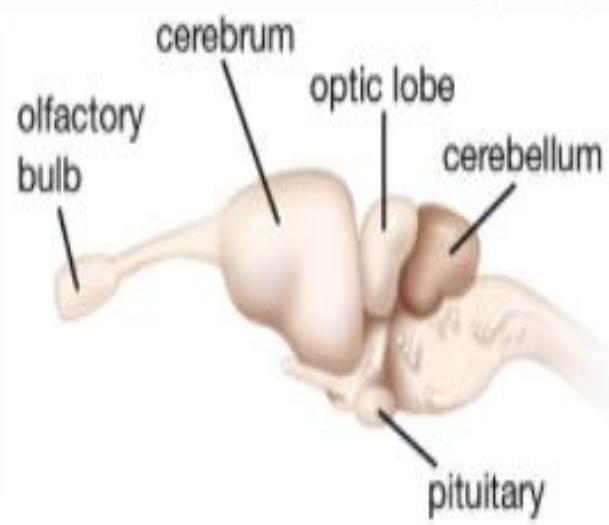

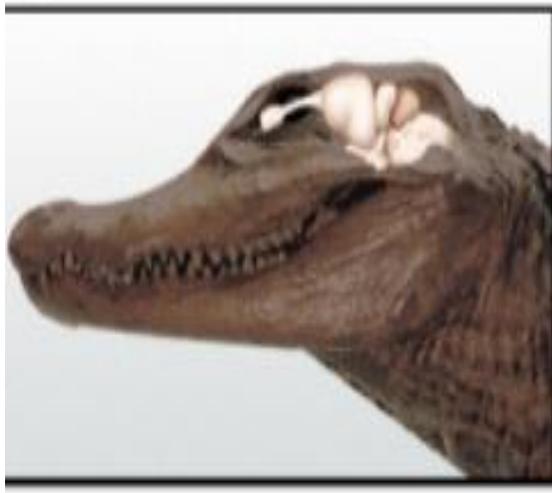

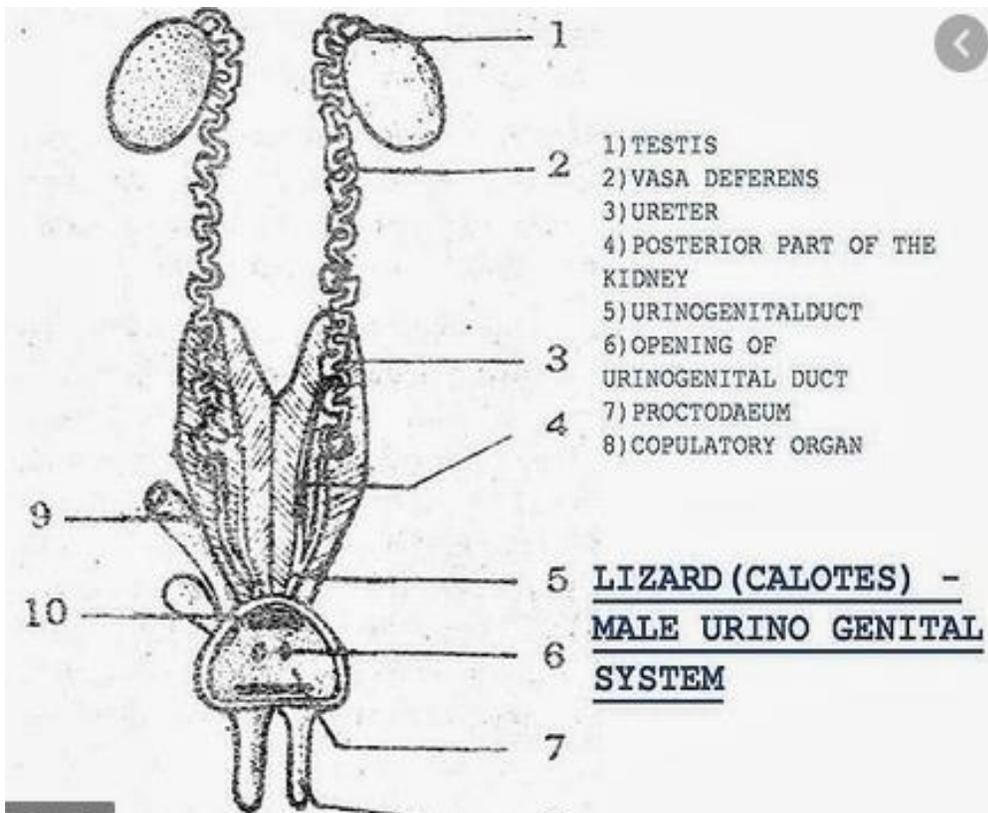

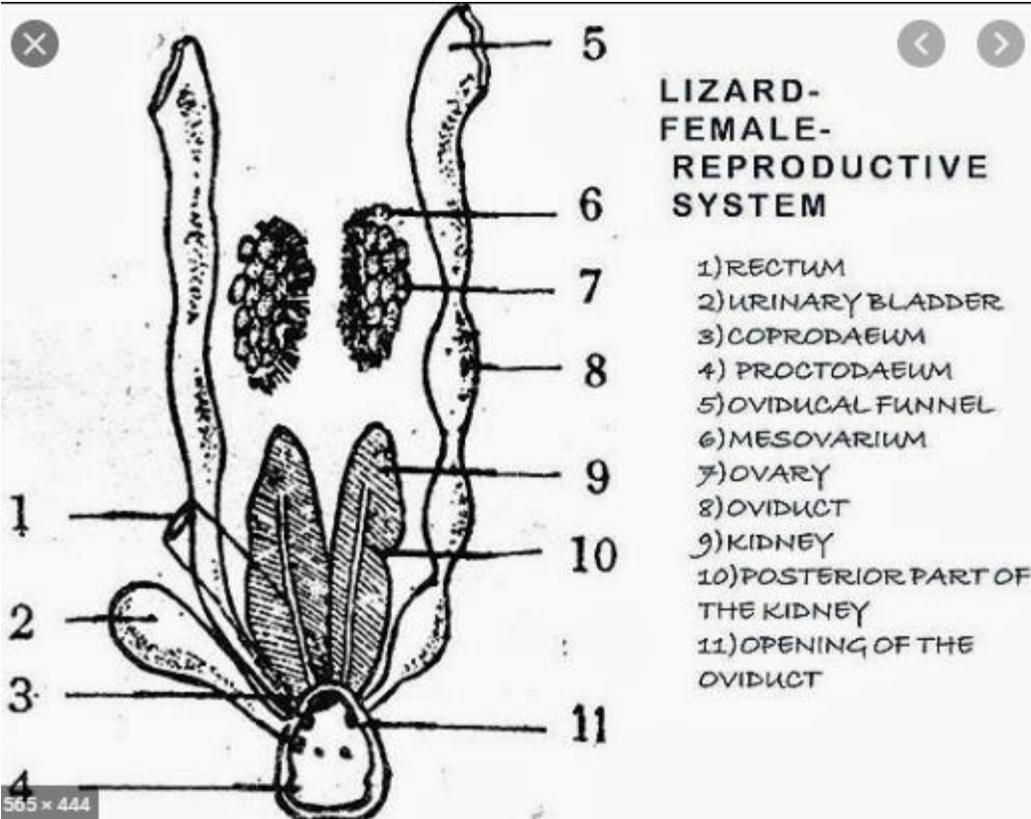

- B) VENTRAL VIEW
- 1) OLFACTORY LOBE
 - 2) OLFACTORY TRACT
 - 3) CEREBRAL HEMISPHERE
 - 4) OPTIC CHIASMA
 - 5) 3RD CRANIAL NERVE
 - 6) MEDULLA OBLONGATA
 - 7) SPINAL CORD
 - 8) INFUNDIBULUM

CALOTES - BRAIN

Brain structure of the reptile (caiman)

CHELONE MYDAS (Green turtle)

TESTUDO (Tortoise)

CROCODYLUS

ALLIGATOR

DRACO (Flying lizard)

CALOTES (Garden lizard)
